# 1 INTRODUCTION

## 1.1 PROJECT DESCRIPTION

The John Masson Park Bike Park project will consist of a paved bike pump track, an unpaved skill track, and an unpaved kids track on an approximately 4.6-acre undeveloped portion of the existing Jesmond Dene Park within the City of Escondido, California. The park property is bounded by Jesmond Dene Road to the north, N Broadway to the east, the Vista Canal Flume access road to the south, and Edwards Access Rd to the west. See **Figure 1-1** for the Vicinity Map. The property is comprised of Assessor Parcel Number (APN) 187-310-09-00. The project includes the grading of the existing parcel for the three proposed bike tracks. The purpose of this report is to present the hydrology analysis and drainage calculations for the design of the Bike Park project.

Figure 1-1 Vicinity Map

## 2 PROJECT SETTING

### 2.1 TOPOGRAPHY

Topographic information for the project was obtained from a land survey by Sampo Engineering in March 2023 and March 2024. The project is located on the USGS Valley Center quadrangle map, see **Appendix A**. The bike park project is located within the Escondido Creek watershed with onsite slopes starting in the northwest and southwest corners (approximate elevations respectively 769 and 768 ft amsl) leading east towards the existing sedimentation basin within Jesmond Dene Park (approximate elevation 759 ft amsl).

### 2.2 PRECIPITATION

Storm intensity values were taken from the County of San Diego Hydrology Manual, 2003. The design storm was the 50-year, and 100-year rainfall event calculated from the County of San Diego Hydrology Manual Rainfall Isopleths and Figure 3-1 (see **Appendix C**) and determined to be 3.1 inches for the 50-year 6-hour event and 3.6 inches for the 100-year 6-hour event.

### 2.3 SOIL TYPES

The condition and type of soil are major factors affecting infiltration and runoff. The Natural Resources Conservation Service (NRCS) has classified soils into four general categories for comparing infiltration and runoff rates. The categories are based on properties that influence runoff, such as water infiltration rate, texture, natural discharge and moisture condition. The runoff potential is based on the amount storm water runoff at the end of a long duration storm that occurs after the soil is saturated.

Soil types were determined using the United States Department of Agriculture (USDA) Web Soil Survey. The project site consists mainly type A soils and type C along the northern boundary of the project. Hydrologic soil group A soils have a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission. Hydrologic soil group C soils have a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

A geotechnical investigation has not yet been performed at the project site. See **Appendix B** for soils information.

### 2.4 LAND USE

The project site location is within the City of Escondido, California. The entirety of the existing park is located within the City's OS-P: Open Space/Park zoning. The land use designation is P: Public Land per Open Space.

### 2.5 GROUNDWATER

Geotechnical investigation was not performed on this project site. Per SGMA Data Viewer, groundwater depth of nearby monitoring well (11S02W34M002S) is approximately 30 feet.

## 2.6 FEMA MAPPING

The project site is located within Zone X of the FEMA Flood Insurance Rate Map (FIRM), which is defined as an area of minimal flood hazard, outside the 500-year flood level. See **Appendix H** for FEMA map.

## 2.7 CLEAN WATER ACT SECTION 404 PERMIT AND 401 CERTIFICATION

The physical alteration of water bodies, including wetlands and streams, are regulated by federal and state statutes under Section 401 (Certification) and Section 404 (Permits) of the Federal Clean Water Act. This project does not propose any discharge of dredged and/or fill material within any Waters of the U.S., therefore, is not subject to the Clean Water Act Sections 404 Permit and 401 Certification.

# 3 HYDROLOGIC ANALYSIS

## 3.1 METHODOLOGY

The Modified Rational Method was used to analyze the hydrology for the project. This methodology is typically used for small basins less than 500 acres in size because a uniform rainfall distribution is assumed for the entire duration. Drainage calculations comply with the requirements outlined in the County of San Diego Hydrology Manual, 2003. The San Diego County Advanced Engineering Software (AES) computer program was used for the Modified Rational Method analysis to calculate peak flow for the 2, 5, 10, 25, 50, and 100-year storm events under existing and proposed conditions. This program uses parameters from the County of San Diego Hydrology Manual to estimate times of concentration and peak flow rates.

### 3.1.1 GEOMETRY

Sub-basin boundaries, initial subareas, and flow paths were delineated for each sub-basin with AutoCAD Civil 3D software. These hydrologic parameters are shown for existing conditions and proposed conditions in **Exhibit A** and **Exhibit B**. Point elevations and surfaces within Civil 3D were also used to determine flow path slopes and estimate the shape of routing reaches. A summary of the existing condition and proposed condition inputs into the AES models are included in **Appendix A**. Topography for the project area was obtained from a land survey by Samp Engineering in 2023 and 2024 and is based on the City of Escondido BM. One-meter resolution DEM topography for offsite drainage areas was obtained from the USGS National Map.

### 3.1.2 INTENSITY AND TIME OF CONCENTRATION

Rainfall data for frequency events were taken from the County of San Diego Hydrology Manual Rainfall Isopluvials to determine the appropriate precipitation for the project site. This duration precipitation value was then inputted directly into AES for each frequency event. AES software was used to calculate the appropriate time of concentration for each sub-basin. The AES software then calculates an intensity based on the calculated time of concentration.

### 3.1.3 RUNOFF COEFFICIENT AND LOSS RATES

AES software was used to calculate loss rates and subsequent runoff coefficients for each sub-basin based on land use type and hydrologic soil group. The existing conditions utilized for the model was chaparral broadleaf for offsite conditions and lawn/park for onsite condition. The proposed conditions land use is

broadleaf (chaparral) for offsite condition and dirt and paved for onsite. Hydrologic soil group A was used for the entire site.

### 3.2 EXISTING CONDITIONS

The project site overland flows from the northwest corner and the southwest corner towards the east, into the existing desilting basin within Jesmond Dene Park.

Runoff coefficients for the existing site was based on the County of San Diego Hydrology Manual and is identified below in **Table 3-1** for undeveloped sites. See **Exhibit A** for **Existing Drainage Exhibit**. The hydrology model results are presented in **Appendix D**.

Table 3-1 Existing Conditions Hydrology

Drainage Area	Runoff Coefficient	Area (acres)	% Impervious	Flow Rate (cfs)					
				2 Year	5 Year	10 Year	25 Year	50 Year	100 Year
1 (Offsite)	0.2	9.16	0	4.74	5.91	7.27	8.48	9.21	11.19
2 (Onsite)	0.2	2.28	0	0.65	0.89	1.08	1.31	1.36	1.70
3 (Offsite)	0.2	2.82	0	1.35	1.70	2.15	2.41	2.61	3.18
4 (Onsite)	0.2	2.28	0	0.55	0.74	0.88	1.03	1.14	1.44
Total		16.54	0		9.24	11.38	13.23	14.32	17.51

### 3.3 PROPOSED CONDITIONS

Proposed hydrologic calculations have been prepared for both onsite and offsite improvements of the project. Tributary areas were delineated based on proposed grading for the project. The final development will be approximately 8% impervious area and 92% landscape/dirt. The San Diego County Advanced Engineering Software (AES) computer program was used for the Modified Rational Method analysis to calculate peak flow for the 2, 5, 10, 25, 50, and 100-year storm events under proposed conditions. Runoff generated from the site will be collected by onsite inlets, conveyed through a swale system, and discharge into an onsite infiltration basin for treatment and detention. This basin will be designed for conjunctive use to 1) filter and treat the water quality storm event volume by means of infiltration as documented in the project specific SWQMP, 2) Reduce peak runoff to hydromodification requirements and 3) Reduce 100-year discharge to pre-development flow rate.

The project will discharge all flows through the point of compliance in the eastern portion of the project by making a connection to the existing City-operated desilting basin within Jesmond Dene Park.

With the overall project site being 8% impervious and drainage area DA 4 being 13% impervious, the Runoff Coefficient used in the AES calculations was 0.34, which is used for approximately 20% impervious condition for soil group A in the San Diego County Hydrology Manual Table 3-1. The model was run using residential land use because AES model does not provide a value for C that was similar to site conditions with less than 20% impervious area. See **Exhibit B** for **Proposed Drainage Exhibit**. The hydrology model results are presented in **Appendix E**.

All runoff that is collected from offsite will be conveyed through a drainage ditch along the parameter of the site to the offsite desilting basin. This portion of runoff peak flow was calculated using the rational method and runoff coefficient value of 0.2 as it is all existing landscaping. See **Appendix E** for calculations.

See **Table 3-2** for the Proposed Conditions Hydrology. This table describes the flow rate before the site is routed through the detention basin for mitigation. See **Section 4.1.3** and **Table 4-1** for mitigated flows. All flows from the onsite detention basin and offsite ultimately reach the existing desilting basin. There are two points of compliance for the project. One is at the proposed infiltration basin and the other is at the existing desilting basin.

Table 3–2 Proposed Conditions Hydrology

Discharge Location	Runoff Coefficient	Area (acres)	% Impervious Area	Flow Rate (cfs)				
				5 Year	10 Year	25 Year	50 Year	100 Year
1 (Offsite)	0.20	9.16	0	5.91	7.27	8.48	9.21	11.19
2 (Onsite)	0.20	1.94	0	0.71	0.86	1.05	1.16	1.37
3 (Offsite)	0.20	2.82	0	1.70	2.15	2.41	2.61	3.18
4 (Onsite)	0.34	2.62	13	1.86	2.29	2.71	2.99	3.66
Total		16.54	8%	10.18	12.57	14.65	15.97	19.40

## 4 HYDRAULIC ANALYSIS

### 4.1 METHODOLOGY

Drainage structures were designed for the John Masson Bike Park project according to the procedures and methodologies outlined in the County of San Diego Hydraulic Design Manual, 2015. The proposed drainage network is included on the **Proposed Drainage Exhibit, Exhibit B**.

#### 4.1.1 INFILTRATION BASIN CALCULATIONS

The development of this site results in an increase of onsite peak discharge runoff. One infiltration basin is proposed to mitigate peak flows by storing stormwater runoff and controlling the release of flow. The proposed basin will be located along the eastern edge of the bike park site. The project is required to mitigate for downstream hydromodification and detain for the 100-year peak flow rate. The project specific Stormwater Quality Management Plan (SWQMP) determined the storage volume and outlet orifice required to mitigate for hydromodification. Orifice calculations were prepared to determine the size of the outlets to meet hydromodification requirements and are used in the flood routing for the peak storm events. See **Appendix F** for the outlet rating curves for each basin. See project specific SWQMP for hydromodification compliance documentation.

To size the peak attenuation volume required, the Rational Method hydrology results were input into Rick Rat Hydrographs to develop a hydrograph. The proposed hydrograph was routed using the PCSWMM software with the calculated basin size and a riser structure to determine peak flow rates and maximum elevation of the basin. See **Appendix F** for infiltration basin calculations and **Table 4-1** summarizing the basin routing results. The project peak flow rates are less than the pre-project flow rate for all storm events per the criteria above.

Table 4-1 Proposed Onsite Infiltration Basin Summary

Storm Event	Existing Runoff (DA 2, 4)	Proposed Runoff Before Mitigation (DA 2, 4)	Proposed Runoff After Mitigation	Runoff Detained	Maximum Water Surface Elevation
(yr)	Q (cfs)	Q (cfs)	Q (cfs)	Q (cfs)	ft
5	1.63	2.57	0.35	2.22	755.6
10	1.96	3.15	1.07	2.08	755.7
25	2.34	3.76	1.46	2.3	756
50	2.50	4.15	1.62	2.53	756.1
100	3.14	5.03	1.9	3.13	756.4
Top of Basin					758.9
100 Year Freeboard (feet)					2.5
Top of Riser					755.4
Basin Volume Provided (cubic feet)					23,037
Finished Grade (feet)					752.4

Below is a summary of the discharge leaving the site in the existing, proposed before mitigation, and proposed after mitigation condition for the 50- and 100-year storm event at the Point of Compliance. This table demonstrates that the project detains flows to less than the existing site runoff.

Table 4-2 Summary of Discharge at POC 1

Total % Impervious	Existing Drainage Area to POC	Proposed Drainage Area to POC	Storm Event	Existing Runoff	Proposed Runoff Before Mitigation	Proposed Runoff After Mitigation
	(ac)	(ac)	(yr)	Q (cfs)	Q (cfs)	Q (cfs)
8%	4.56	4.56	5	1.63	2.57	0.35
			10	1.96	3.15	1.07
			25	2.34	3.76	1.46
			50	2.50	4.15	1.62
			100	3.14	5.03	1.9

Drawdown times for the detention basins are required to drawdown the surface ponding within 96 hours per section 6.3.7 Drawdown Time of the 2016 Storm Water Standards Part 1: BMP Design Manual for Permanent Site Design, Storm Water Treatment and Hydromodification Management. See **Table 4-3** below, for a summary of storm event drawdown times for the 5, 10, 25, 50, and 100-year storm, assuming 0.5 inches/hour infiltration rate. These drawdown times represent the duration it takes to drain the surface storage area after the end of the storm event (6 hrs) for each basin and are supported by the hydrographs and PCSWMM results in **Appendix F**.

Table 4-3 Proposed Infiltration Basin Drawdown Summary

Storm Event	Depth in Basin After 6 Hour Storm	Drawdown Time
(yr)	ft	hrs
5	3.05	73.2
10	3.07	73.68
25	3.08	73.92
50	3.08	73.92
100	3.06	73.44

#### 4.1.2 EARTHEN TRIANGULAR CHANNEL

Proposed earthen ditch is located at the southern parameter of the project site capturing and routing offsite runoff to existing sedimentation basin. Earthen channel size was calculated using the FlowMaster computer program. This program's input consists of ditch shape, roughness coefficient, channel slope, left/right side-slope, depth for a specific discharge. A triangular channel was designed at a roughness co-efficient of 0.020 and a 10-year storm capacity. The FlowMaster inlet design output files can be referenced in **Appendix G**.

## 5 WATER QUALITY

### 5.1 POST CONSTRUCTION BMP

A project specific Storm Water Quality Management Plan (SWQMP) has been prepared. Self-mitigating areas are proposed throughout the project to provide stormwater treatment for the pollutants where practical. Infiltration basin is also proposed onsite to capture 100-year run-off and account for hydromodification. Infiltration calculations are provided in the project specific SWQMP.

### 5.2 EROSION AND SEDIMENTATION

The proposed park site will be approximately 8% impervious with landscaped slopes and parkway landscaped areas. Graded and disturbed areas will be re-vegetated and landscaped to minimize erosion. The post construction site will have minimal risks of erosion occurring given proper plant establishment and transport of sediments downstream will be significantly reduced by means of pretreatment and onsite infiltration basin. It will be critical to maintain construction site BMPs throughout the construction duration.

## 6 DRAINAGE IMPROVEMENTS

This drainage study was prepared to document the storm drain design for John Masson Bike Park. The project includes the construction of four bike tracks. The drainage improvements throughout the project consist of self-mitigating areas, swales, earthen channel and infiltration basin.

The proposed drainage improvements are designed to mitigate flood and water quality impacts such that no adjacent properties will be negatively impacted from runoff generated by the development of this project. This Drainage Study documents that this project does not create any negative drainage impacts to any adjacent properties.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

**Warning:** Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California

Survey Area Data: Version 20, Aug 30, 2024

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 14, 2022—Mar 17, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
CIG2	Cieneba coarse sandy loam, 30 to 65 percent slopes, eroded	3.3	16.4%
RaB	Ramona sandy loam, 2 to 5 percent slopes	8.5	42.7%
RaC	Ramona sandy loam, 5 to 9 percent slopes	0.1	0.5%
VaA	Visalia sandy loam, 0 to 2 percent slopes	8.1	40.4%
<b>Totals for Area of Interest</b>		<b>20.0</b>	<b>100.0%</b>

## San Diego County Area, California

### VaA—Visalia sandy loam, 0 to 2 percent slopes

#### Map Unit Setting

*National map unit symbol:* hbh2

*Elevation:* 600 to 1,200 feet

*Mean annual precipitation:* 15 inches

*Mean annual air temperature:* 57 degrees F

*Frost-free period:* 200 to 350 days

*Farmland classification:* Prime farmland if irrigated and either protected from flooding or not frequently flooded during the growing season

#### Map Unit Composition

*Visalia and similar soils:* 85 percent

*Minor components:* 15 percent

*Estimates are based on observations, descriptions, and transects of the mapunit.*

#### Description of Visalia

##### Setting

*Landform:* Alluvial fans

*Landform position (two-dimensional):* Toeslope

*Landform position (three-dimensional):* Riser, flat

*Down-slope shape:* Linear

*Across-slope shape:* Convex

*Parent material:* Alluvium derived from granite

##### Typical profile

*H1 - 0 to 12 inches:* sandy loam

*H2 - 12 to 40 inches:* fine sandy loam

*H3 - 40 to 60 inches:* very fine sandy loam

##### Properties and qualities

*Slope:* 0 to 2 percent

*Depth to restrictive feature:* More than 80 inches

*Drainage class:* Well drained

*Runoff class:* Very low

*Capacity of the most limiting layer to transmit water (Ksat):* High  
(1.98 to 5.95 in/hr)

*Depth to water table:* More than 80 inches

*Frequency of flooding:* Rare

*Frequency of ponding:* None

*Available water supply, 0 to 60 inches:* Moderate (about 7.8 inches)

##### Interpretive groups

*Land capability classification (irrigated):* 1

*Land capability classification (nonirrigated):* 2c

**Hydrologic Soil Group: A**

*Ecological site:* R019XG911CA - Loamy Fan  
*Hydric soil rating:* No

#### **Minor Components**

##### **Greenfield**

*Percent of map unit:* 5 percent  
*Hydric soil rating:* No

##### **Grangeville**

*Percent of map unit:* 5 percent  
*Hydric soil rating:* No

## APPENDIX C

### HYDROLOGY MANUAL EXCERPTS

Note that the Initial Time of Concentration should be reflective of the general land-use at the upstream end of a drainage basin. A single lot with an area of two or less acres does not have a significant effect where the drainage basin area is 20 to 600 acres.

Table 3-2 provides limits of the length (Maximum Length ( $L_M$ )) of sheet flow to be used in hydrology studies. Initial  $T_i$  values based on average C values for the Land Use Element are also included. These values can be used in planning and design applications as described below. Exceptions may be approved by the "Regulating Agency" when submitted with a detailed study.

**Table 3-2**

**MAXIMUM OVERLAND FLOW LENGTH ( $L_M$ )  
& INITIAL TIME OF CONCENTRATION ( $T_i$ )**

**Table 3-1  
RUNOFF COEFFICIENTS FOR URBAN AREAS**

Land Use		Runoff Coefficient "C"				
		% IMPER.	Soil Type			
NRCS Elements	County Elements		A	B	C	D
Undisturbed Natural Terrain (Natural)	Permanent Open Space	0*	0.20	0.25	0.30	0.35
Low Density Residential (LDR)	Residential, 1.0 DU/A or less	10	0.27	0.32	0.36	0.41
Low Density Residential (LDR)	Residential, 2.0 DU/A or less	20	0.34	0.38	0.42	0.46
Low Density Residential (LDR)	Residential, 2.9 DU/A or less	25	0.38	0.41	0.45	0.49
Medium Density Residential (MDR)	Residential, 4.3 DU/A or less	30	0.41	0.45	0.48	0.52
Medium Density Residential (MDR)	Residential, 7.3 DU/A or less	40	0.48	0.51	0.54	0.57
Medium Density Residential (MDR)	Residential, 10.9 DU/A or less	45	0.52	0.54	0.57	0.60
Medium Density Residential (MDR)	Residential, 14.5 DU/A or less	50	0.55	0.58	0.60	0.63
High Density Residential (HDR)	Residential, 24.0 DU/A or less	65	0.66	0.67	0.69	0.71
High Density Residential (HDR)	Residential, 43.0 DU/A or less	80	0.76	0.77	0.78	0.79
Commercial/Industrial (N. Com)	Neighborhood Commercial	80	0.76	0.77	0.78	0.79
Commercial/Industrial (G. Com)	General Commercial	85	0.80	0.80	0.81	0.82
Commercial/Industrial (O.P. Com)	Office Professional/Commercial	90	0.83	0.84	0.84	0.85
Commercial/Industrial (Limited I.)	Limited Industrial	90	0.83	0.84	0.84	0.85
Commercial/Industrial (General I.)	General Industrial	95	0.87	0.87	0.87	0.87

\*The values associated with 0% impervious may be used for direct calculation of the runoff coefficient as described in Section 3.1.2 (representing the pervious runoff coefficient, Cp, for the soil type), or for areas that will remain undisturbed in perpetuity. Justification must be given that the area will remain natural forever (e.g., the area is located in Cleveland National Forest).

DU/A = dwelling units per acre

NRCS = National Resources Conservation Service

EXAMPLE:

Given: Watercourse Distance (D) = 70 Feet  
 Slope (s) = 1.3%  
 Runoff Coefficient (C) = 0.41  
 Overland Flow Time (T) = 9.5 Minutes

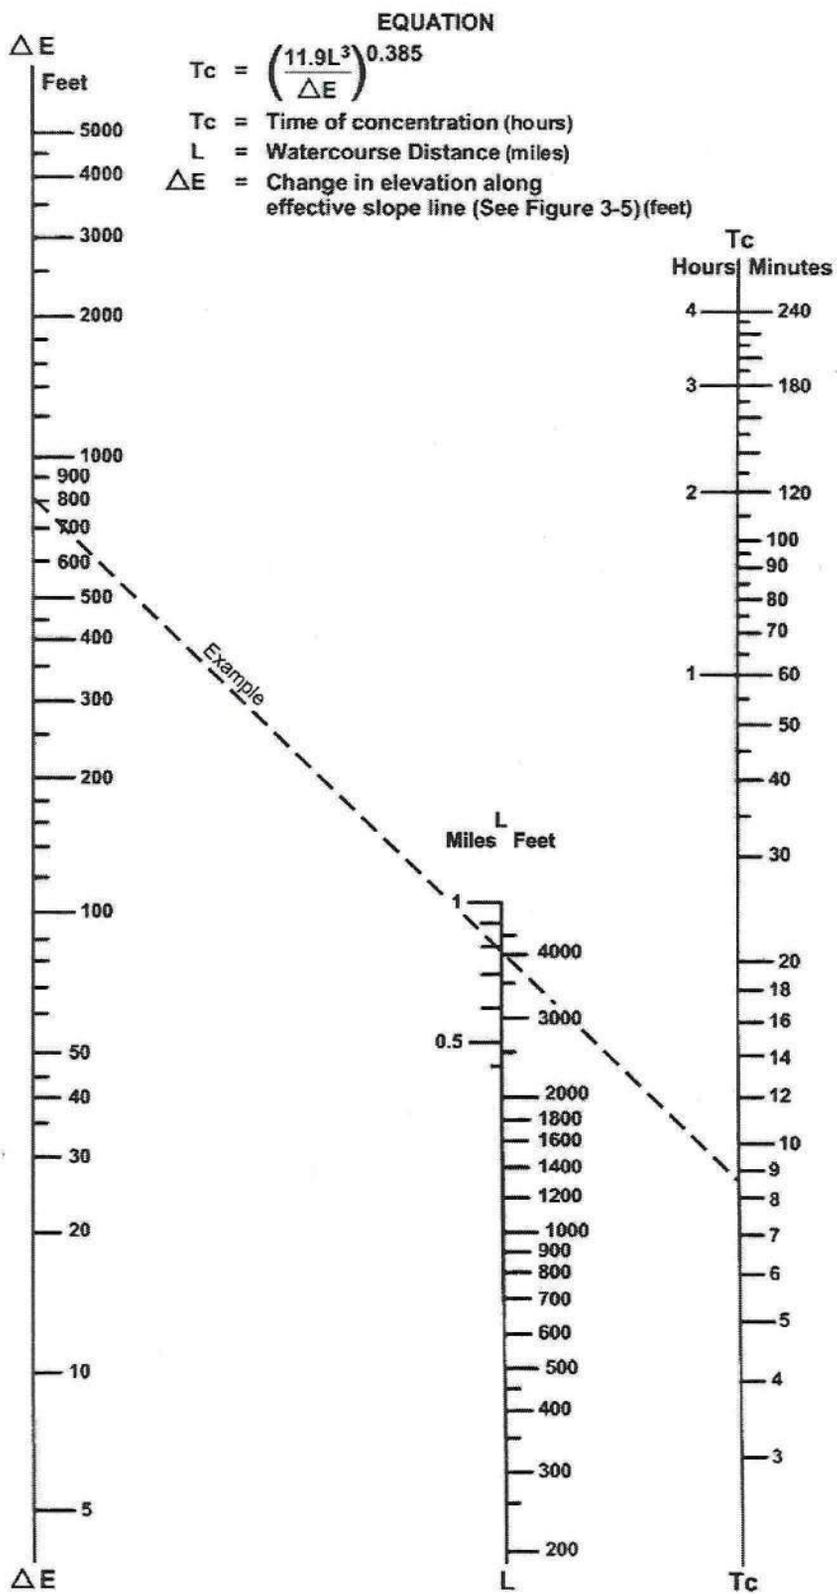

$$T = \frac{1.8(1.1-C)\sqrt{D}}{\sqrt[3]{s}}$$

SOURCE: Airport Drainage, Federal Aviation Administration, 1965

Rational Formula - Overland Time of Flow Nomograph

FIGURE

Nomograph for Determination of  
Time of Concentration ( $T_c$ ) or Travel Time ( $T_t$ ) for Natural Watersheds

FIGURE

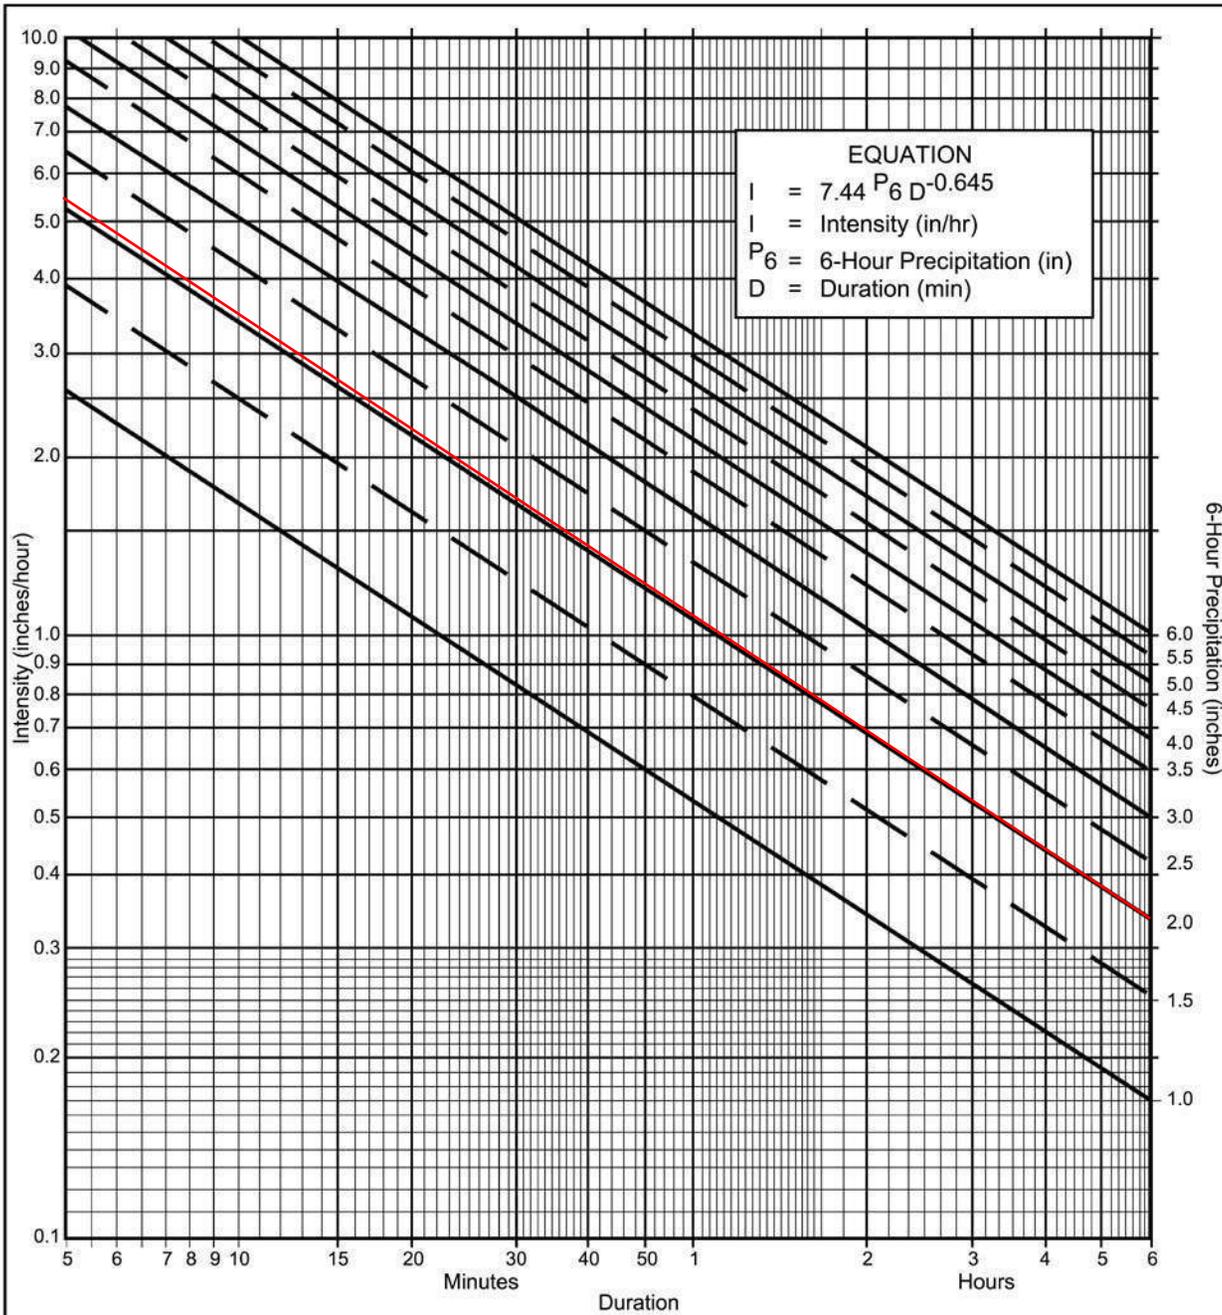

**3-4**

**EXAMPLE:**  
 Given:  $Q = 10$   $S = 2.5\%$   
 Chart gives: Depth = 0.4, Velocity = 4.4 f.p.s.

SOURCE: San Diego County Department of Special District Services Design Manual

Gutter and Roadway Discharge - Velocity Chart

**Directions for Application:**

- (1) From precipitation maps determine 6 hr and 24 hr amounts for the selected frequency. These maps are included in the County Hydrology Manual (10, 50, and 100 yr maps included in the Design and Procedure Manual).
- (2) Adjust 6 hr precipitation (if necessary) so that it is within the range of 45% to 65% of the 24 hr precipitation (not applicable to Desert).
- (3) Plot 6 hr precipitation on the right side of the chart.
- (4) Draw a line through the point parallel to the plotted lines.
- (5) This line is the intensity-duration curve for the location being analyzed.

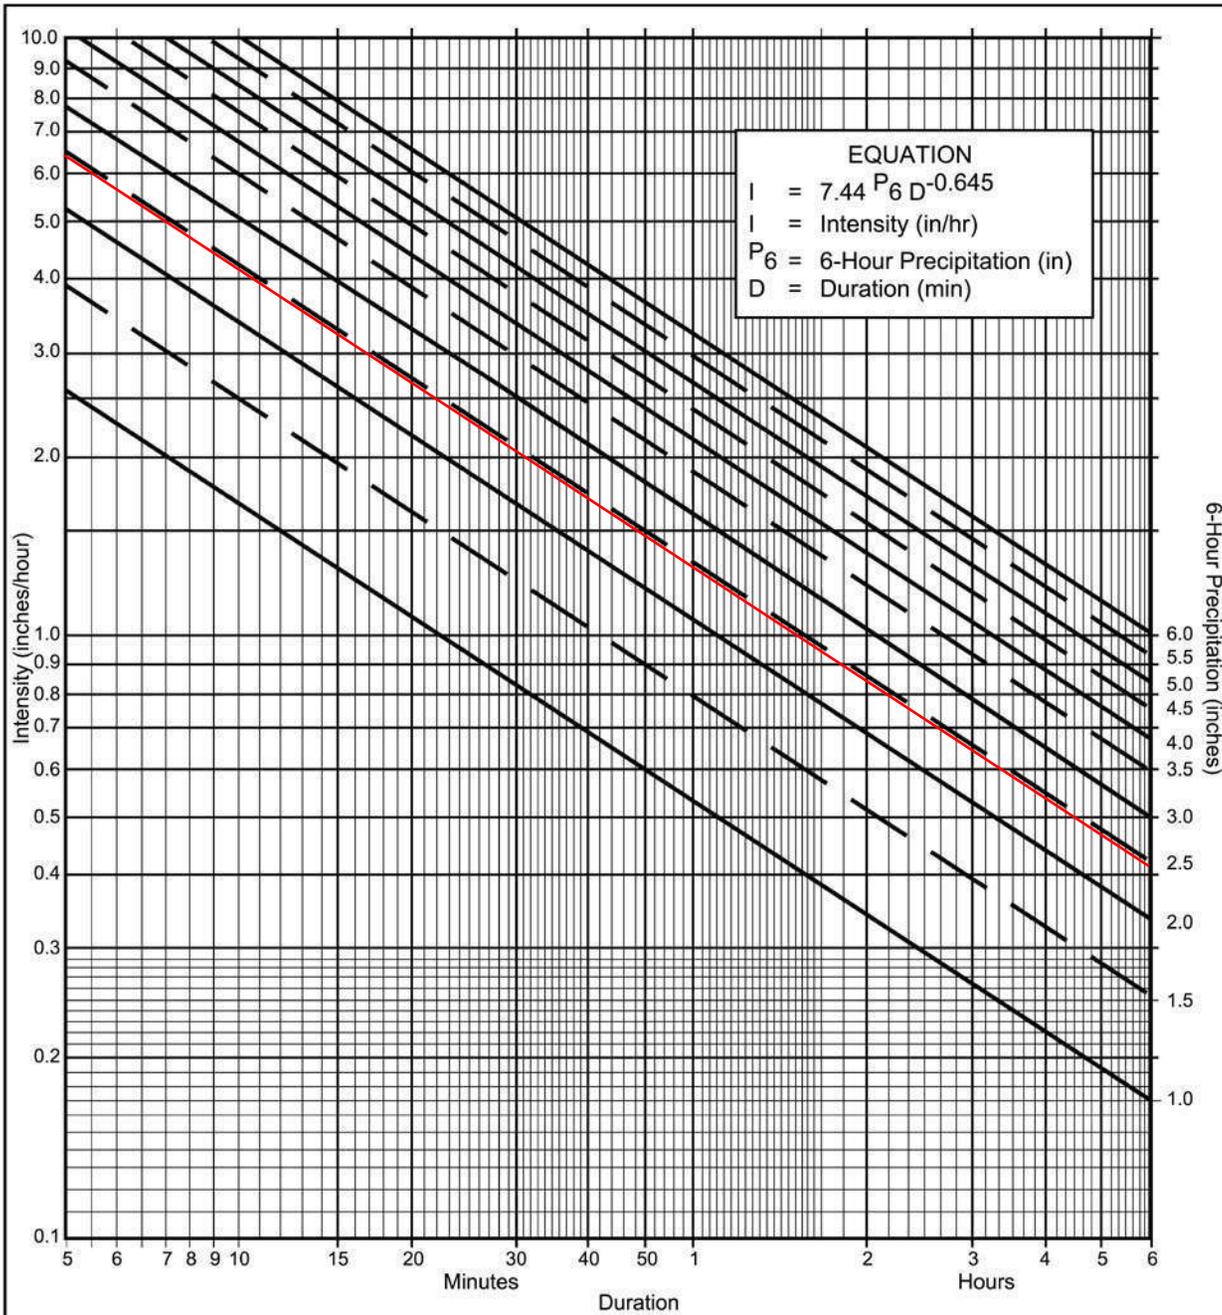

**Application Form:**

- (a) Selected frequency 5 year
- (b)  $P_6 = 2.0$  in.,  $P_{24} = 3.8$  in.,  $\frac{P_6}{P_{24}} = 53$  %<sup>(2)</sup>
- (c) Adjusted  $P_6^{(2)} = 2.0$  in.
- (d)  $t_x = 5$  min.
- (e)  $I = 5.27$  in./hr.

Note: This chart replaces the Intensity-Duration-Frequency curves used since 1965.

Max. link peak velocity (ft/s)	0
Min. link peak velocity (ft/s)	10000000
Num. conduits surcharged	0
Max. conduit surcharge duration (hours)	0
Max. conduit capacity limited duration (hours)	0

### Summary 3D: Results statistics

Name	JohnMason_InfilBasin_10yr_PostDev
Max. subcatchment total runoff (MG)	n/a
Max. subcatchment peak runoff (cfs)	n/a
Max. subcatchment runoff coefficient	n/a
Max. subcatchment total precip (in)	n/a
Min. subcatchment total precip (in)	n/a
Max. node depth (ft)	3.31
Num. nodes surcharged	0
Max. node surcharge duration (hours)	0
Max. node height above crown (ft)	0

### Summary 3D: Results statistics (continued...)

Name	JohnMason_InfilBasin_10yr_PostDev
Min. node depth below rim (ft)	0
Num. nodes flooded	0
Max. node flooding duration (hours)	0
Max. node flood volume (MG)	0
Max. node ponded volume or depth (acre-in/1000 ft <sup>3</sup> /ft)	0
Max. storage volume (1000 ft <sup>3</sup> )	8.635
Max. storage percent full (%)	33
Max. outfall flow frequency (%)	99.85
Max. outfall peak flow (cfs)	1.08
Max. outfall total volume (MG)	0.046
Total outfall volume (MG)	0.046
Max. link peak flow (cfs)	1.08
Max. link peak velocity (ft/s)	0
Min. link peak velocity (ft/s)	100000000
Num. conduits surcharged	0
Max. conduit surcharge duration (hours)	0
Max. conduit capacity limited duration (hours)	0

### Summary 3E: Results statistics

Name	JohnMason_InfilBasin_5yr_PostDev
Max. subcatchment total runoff (MG)	n/a
Max. subcatchment peak runoff (cfs)	n/a
Max. subcatchment runoff coefficient	n/a
Max. subcatchment total precip (in)	n/a
Min. subcatchment total precip (in)	n/a
Max. node depth (ft)	3.12
Num. nodes surcharged	0
Max. node surcharge duration (hours)	0
Max. node height above crown (ft)	0
Min. node depth below rim (ft)	0
Num. nodes flooded	0
Max. node flooding duration (hours)	0
Max. node flood volume (MG)	0
Max. node ponded volume or depth (acre-in/1000 ft <sup>3</sup> /ft)	0
Max. storage volume (1000 ft <sup>3</sup> )	7.903
Max. storage percent full (%)	30
Max. outfall flow frequency (%)	99.79
Max. outfall peak flow (cfs)	0.36

Summary 3E: Results statistics (continued...)

Name	JohnMason_InfilBasin_5yr_PostDev
Max. outfall total volume (MG)	0.031
Total outfall volume (MG)	0.031
Max. link peak flow (cfs)	0.36
Max. link peak velocity (ft/s)	0
Min. link peak velocity (ft/s)	100000000
Num. conduits surcharged	0
Max. conduit surcharge duration (hours)	0
Max. conduit capacity limited duration (hours)	0

## APPENDIX G

### EARTHEN TRIANGULAR CHANNEL CALCULATIONS

## Offsite V Ditch - 10 Year

Project Description	
Friction Method	Manning
Solve For	Formula Normal Depth
Input Data	
Roughness Coefficient	0.020
Channel Slope	0.020 ft/ft
Left Side Slope	1.500 H:V
Right Side Slope	1.500 H:V
Discharge	9.41 cfs
Results	
Normal Depth	12.3 in
Flow Area	1.6 ft <sup>2</sup>
Wetted Perimeter	3.7 ft
Hydraulic Radius	5.1 in
Top Width	3.08 ft
Critical Depth	14.4 in
Critical Slope	0.009 ft/ft
Velocity	5.96 ft/s
Velocity Head	0.55 ft
Specific Energy	1.58 ft
Froude Number	1.466
Flow Type	Supercritical
GVF Input Data	
Downstream Depth	0.0 in
Length	0.0 ft
Number Of Steps	0
GVF Output Data	
Upstream Depth	0.0 in
Profile Description	N/A
Profile Headloss	0.00 ft
Downstream Velocity	Infinity ft/s
Upstream Velocity	Infinity ft/s
Normal Depth	12.3 in
Critical Depth	14.4 in
Channel Slope	0.020 ft/ft
Critical Slope	0.009 ft/ft

# Analysis Results

## POC 1

+ Predeveloped x Mitigated

### Predeveloped Landuse Totals for POC #1

Total Pervious Area: 4.56  
Total Impervious Area: 0

### Mitigated Landuse Totals for POC #1

Total Pervious Area: 4.2  
Total Impervious Area: 0.36

Flow Frequency Method: Cunnane

### Flow Frequency Return Periods for Predeveloped. POC #1

Return Period	Flow(cfs)
2 year	0.538124
5 year	1.306624
10 year	1.544397
25 year	1.978718

### Flow Frequency Return Periods for Mitigated. POC #1

Return Period	Flow(cfs)
2 year	0
5 year	0.541492
10 year	0.997671
25 year	1.753373

# EXHIBIT A

## EXISTING DRAINAGE EXHIBIT

### LEGEND

- EXISTING CONTOUR
- DRAINAGE AREA (DA) BOUNDARY
- DIRECTION OF FLOW
- FLOW PATH
- DRAINAGE AREA NUMBER  
DRAINAGE AREA (IN ACRES)
- RIGHT OF WAY
- POINT OF COMPLIANCE (POC)
- PROPOSED DETENTION BASIN
- PROPOSED STORM DRAIN
- HYDROMODIFICATION AREA (HMA) 1
- HYDROMODIFICATION AREA (HMA) 2
- DRAINAGE NODE NUMBER

#### GENERAL NOTES:

1. DRAINAGE AREAS ARE BASED ON PROJECT LIMITS AND EXISTING TOPOGRAPHY

#### HYDROLOGIC SOIL GROUP:

HYDROLOGIC SOIL TYPE: A

#### DEPTH TO GROUNDWATER:

~ 30 FT

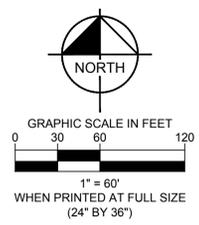

#### CCSYAS:

IN THE EXISTING CONDITION, POTENTIAL CRITICAL COARSE SEDIMENT YIELD AREAS FLOW THROUGH THE PROJECT SITE AND EVENTUALLY TO THE EXISTING DESILTING BASIN. HOWEVER, IN THE PROPOSED CONDITION, THE RUN OFF FROM OFFSITE AREAS (INCLUDING CCSYA) IS BYPASSED THROUGH A PROPOSED DITCH RUNNING ALONG THE PARAMETER OF THE PROJECT SITE, ROUTING THE FLOWS INTO THE EXISTING DESILTING BASIN MATCHING THE EXISTING DRAINAGE CONDITION.

### EXISTING DRAINAGE SUMMARY

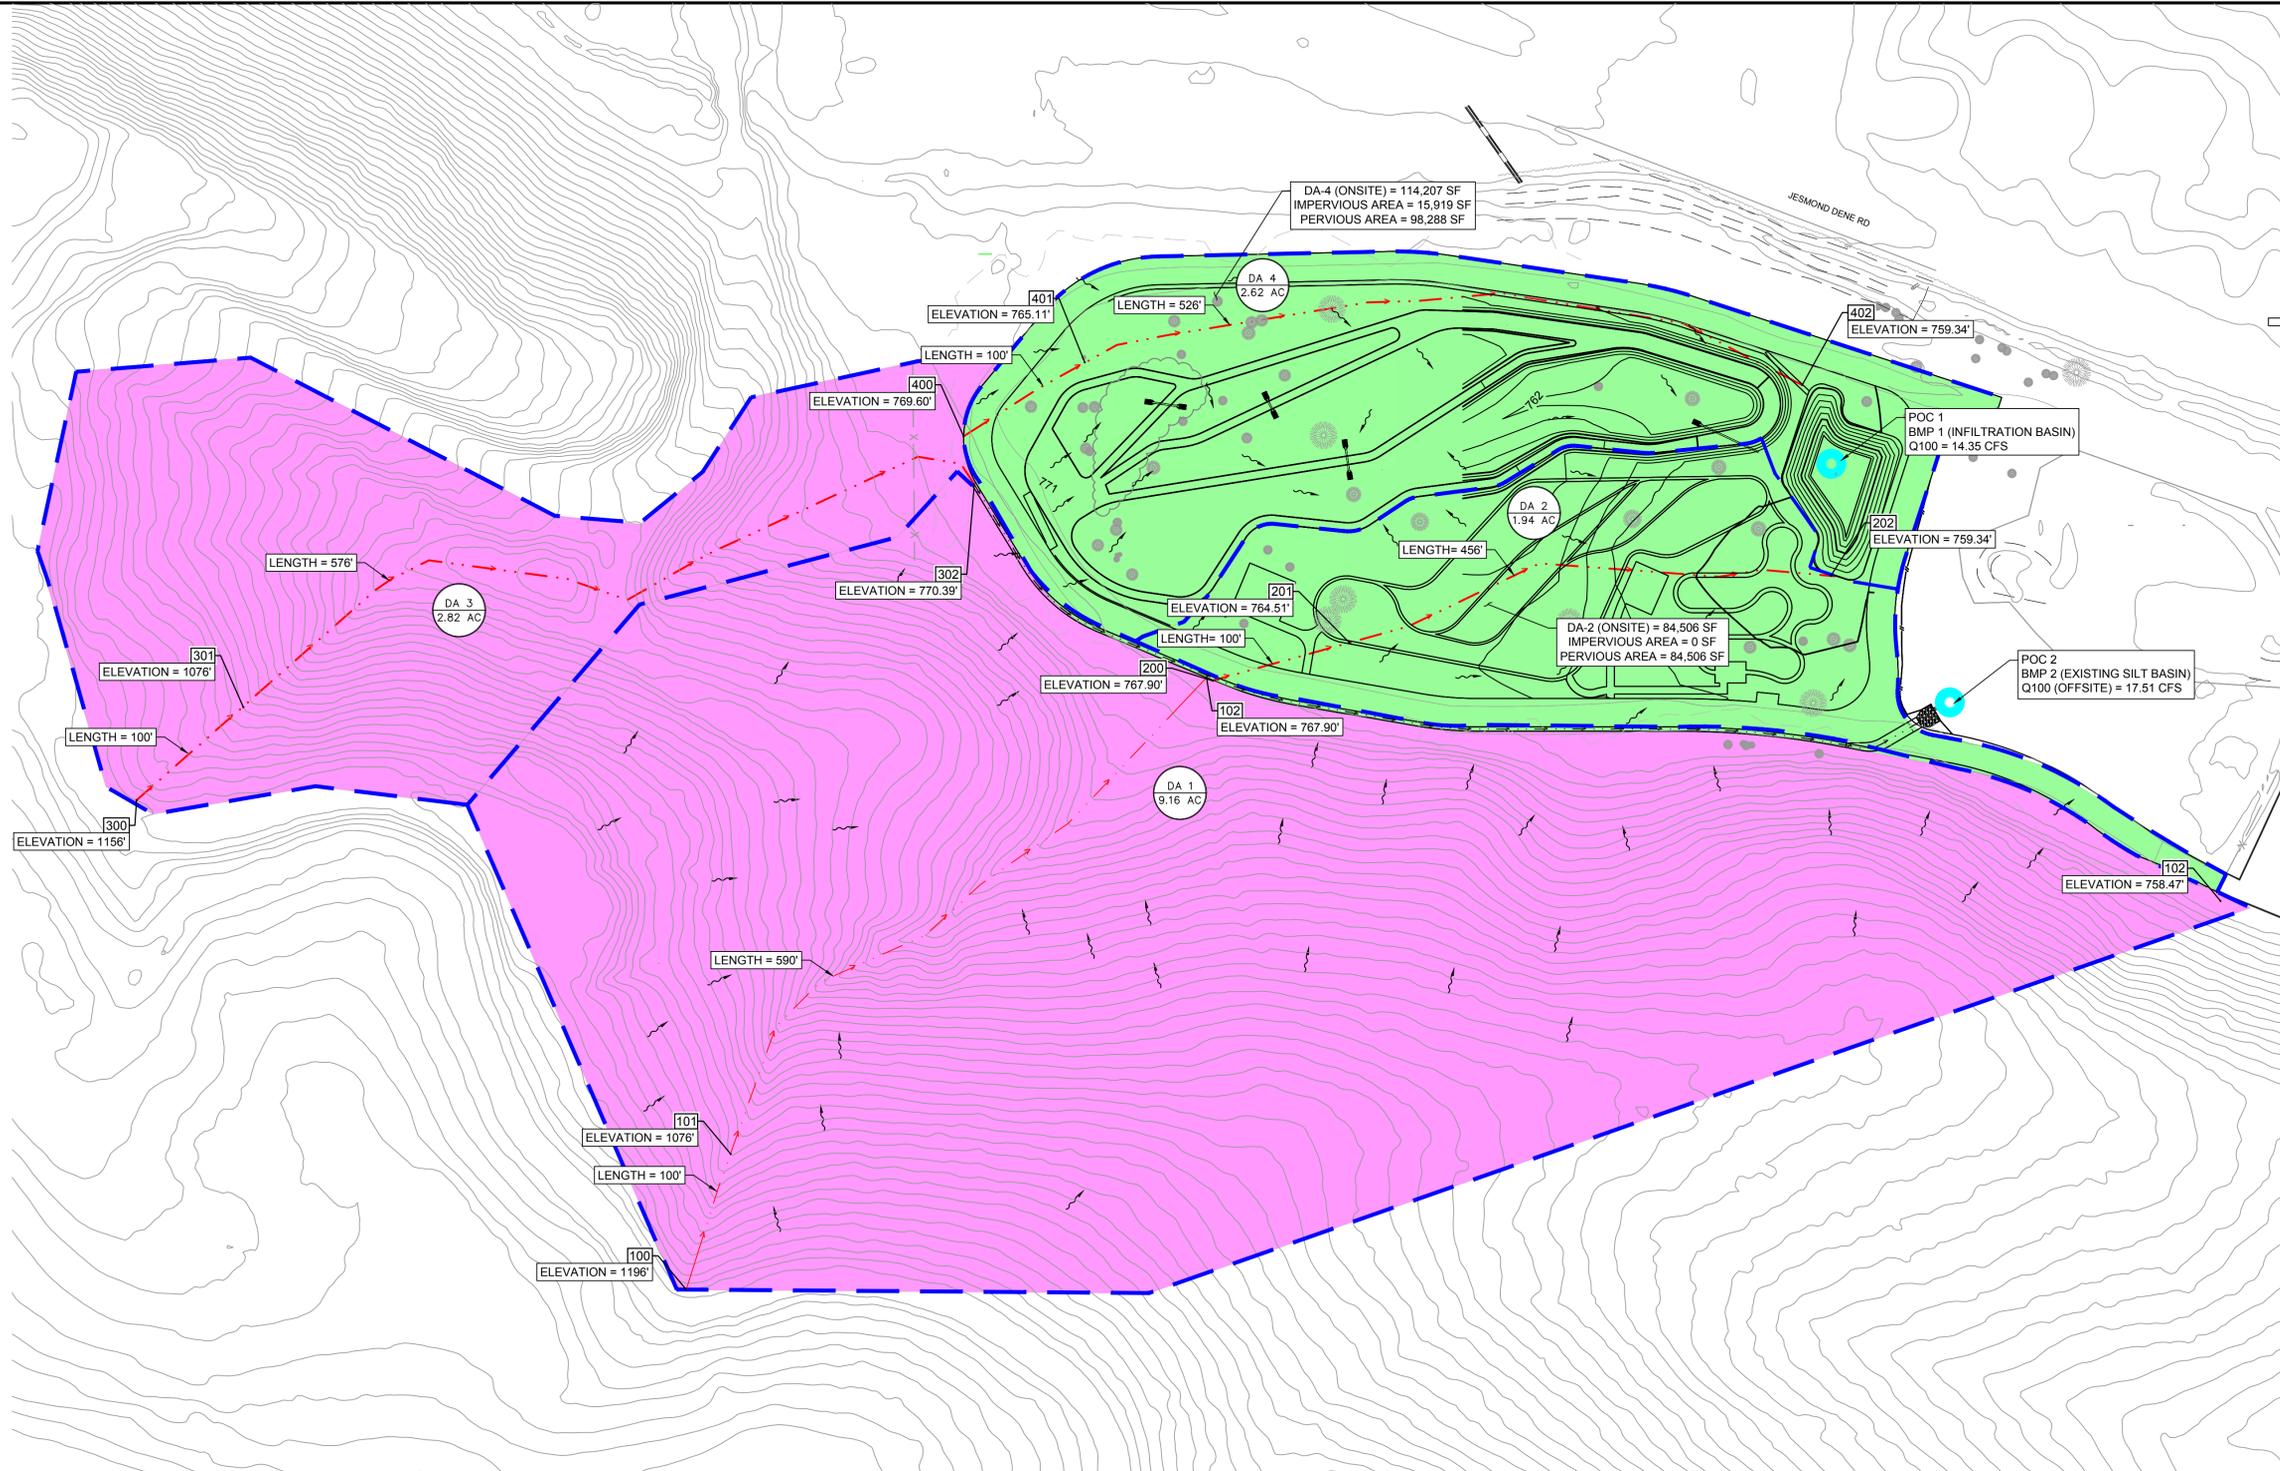

DA	BMP	AREA (AC)	PERVIOUS AREA (AC)	Q100 (CFS)
1	BMP 1	9.16	9.16	11.19
3	BMP 1	2.82	2.82	3.18
2	BMP 1	2.28	2.28	1.70
4	BMP 1	2.28	2.28	1.44
TOTAL		16.54		17.51

\*NOTE: POC 1 ULTIMATELY DISCHARGES TO PACIFIC OCEAN IN BOTH PRE- AND POST-DEVELOPMENT CONDITION. POINT OF COMPLIANCE SHOWN AT EXISTING DESILTING BASIN IN PRE-DEVELOPMENT CONDITION FOR CLARITY.

## EXHIBIT B

### PROPOSED DRAINAGE EXHIBIT

### LEGEND

- EXISTING CONTOUR
- DRAINAGE AREA (DA) BOUNDARY
- DIRECTION OF FLOW
- FLOW PATH
- DRAINAGE AREA NUMBER  
DRAINAGE AREA (IN ACRES)
- RIGHT OF WAY
- POINT OF COMPLIANCE (POC)
- PROPOSED DETENTION BASIN
- PROPOSED STORM DRAIN
- HYDROMODIFICATION AREA (HMA) 1
- HYDROMODIFICATION AREA (HMA) 2
- DRAINAGE NODE NUMBER
- EARTHEN SWALE FLOWPATH

**GENERAL NOTES:**

- DRAINAGE AREAS ARE BASED ON PROJECT LIMITS AND EXISTING AND PROPOSED TOPOGRAPHY

**HYDROLOGIC SOIL GROUP:**  
HYDROLOGIC SOIL TYPE: A

**DEPTH TO GROUNDWATER:**  
~ 30 FT

**CCSYAS:**  
IN THE EXISTING CONDITION, POTENTIAL CRITICAL COARSE SEDIMENT YIELD AREAS FLOW THROUGH THE PROJECT SITE AND EVENTUALLY TO THE EXISTING DESILTING BASIN. HOWEVER, IN THE PROPOSED CONDITION, THE RUN OFF FROM OFFSITE AREAS (INCLUDING CCSYAS) IS BYPASSED THROUGH A PROPOSED DITCH RUNNING ALONG THE PARAMETER OF THE PROJECT SITE, ROUTING THE FLOWS INTO THE EXISTING DESILTING BASIN MATCHING THE EXISTING DRAINAGE CONDITION.

HMA	POC	DA	AREA (AC)	TOTAL AREA (AC)	EXISTING Q100 (CFS)	PROPOSED UNMITIGATED Q100 (CFS)	PROPOSED MITIGATED Q100 (CFS)
HMA 1	BMP 2	1	9.16	11.98	11.19	11.19	-
		3	2.82		3.18	3.18	-
HMA 2	BMP 1	2	1.94	4.56	1.70	1.37	1.90
		4	2.62		1.44	3.66	

\*TREE WELLS DESIGNED TO SATISFY BOTH POLLUTANT CONTROL AND HYDROMODIFICATION MANAGEMENT PERFORMANCE STANDARDS. IN CASES WHERE HYDROMODIFICATION MITIGATION WITHIN THE DA IS INFEASIBLE, THE BASIN WITHIN THE SAME POC WAS DESIGNED TO MITIGATE IMPACTS FROM THE DA. SEE REPORT FOR MORE INFORMATION.  
\*\*INFILTRATION BASIN (BMP 1) IS PROPOSED TO MITIGATE PEAK FLOW EVENTS, WHILE THE TREE WELLS SATISFY BOTH POLLUTANT CONTROL AND HYDROMODIFICATION MANAGEMENT PERFORMANCE STANDARDS. SEE REPORT FOR MORE INFORMATION.
